**DETAILED ACTION**

***Claim Rejections - 35 USC § 102***

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 10-19 are rejected under 35 U.S.C. 102(b) as being anticipated by LUC (US 4,144,110).

Luc discloses the method of processing metal members, comprising the steps of placing a pair of rotors opposite to each other, wherein the rotor having a concave portion, pressing each rotor in a respective central axis direction, the rotor being rotate against the surface of the lapped portions of the metal members, thereby forming a non-molten stirred layer, and locally joining the lapped portions. The stirring inherently results in an unevenness or wavy portion differing in height in a circumferential direction of the respective rotor on each of the tip portions. In addition, the burrs will be inherently removed by the rotors due to the circumferential force of the rotors (figures and col. 13, lines 47-55).

***Response to Arguments***

3. Applicant's arguments filed 10/20/03 have been fully considered but they are not persuasive.

Applicant argues that Luc fails to disclose a pair of rotors each having a concave portion opposite to each other with a lapped portion therebetween. Furthermore, Luc fails to disclose forming a non-molten stirred layer with friction. Examiner respectfully disagrees, since Luc disclose in figure 8, a rotor with a concave portion. In addition, while rotating the rotor as in figure 8, a non-molten stirred layer will form by friction. Therefore the new claims remain rejected.
